

# Fish Weight Prediction

With a dataset of fish species, with some of its characteristics like its vertical, diagonal, length, height, and width. We will try to predict the weight of the fish based on these characteristics. We will use the Linear Regression Method to see whether the weight of the fish is related to these characteristics.

- Species: Species name of fish
- Weight: Weight of fish in gram
- Length1: Vertical length in cm
- Length2: Diagonal length in cm
- Length3: Cross length in cm
- Height: Height in cm
- Width: Diagonal width in cm

```
In [1]:  # Step 1 : import library
import pandas as pd
```

```
In [2]:  # Step 2 : import data
fish = pd.read_csv('https://github.com/ybifoundation/Dataset/raw/main/F')
```

```
In [3]:  fish.head()
```

Out[3]:

	Category	Species	Weight	Height	Width	Length1	Length2	Length3
0	1	Bream	242.0	11.5200	4.0200	23.2	25.4	30.0
1	1	Bream	290.0	12.4800	4.3056	24.0	26.3	31.2
